

Cosmetic alignment of anterior teeth with The T4A

Affordable, invisible, cosmetic dentistry can now be offered to adult patients who do not want expensive, complex orthodontic treatment with fixed braces. The TRAINER for Alignment™ is a removable, single-sized, pre-fabricated, intra-oral appliance, worn by the patient for 1-2 hours daily plus overnight. Used in a 2 phase treatment plan over a period of 6-18 months it can improve the alignment of the anterior teeth. Incorrect tongue position and function plus mouth breathing are often the cause of misaligned teeth. The T4A™ has myofunctional habit correction design features to

the TRAINER4™ Alignment

assist in retraining the oral musculature while aligning the teeth. In orthodontic practice The T4A™ can be used as a pre-finishing positioner or for minor relapse, particularly where tongue-thrusting is a factor. It can also be used simultaneously with appliances like a Crozat or lingual arch developer to offer a more comprehensive, "no-bracket" dental alignment system for a fraction of the cost of systems like INVISALIGN.
